

User Manual: Master Rule Definition Sheet

Configuration Guide for the Rule Engine Evaluation Tool

1. Introduction

This manual explains how to use the Master Rule Definition spreadsheet. This file serves as the configuration layer for the Rule Engine Evaluation tool, defining the logic and thresholds used to screen companies across three evaluation phases.

2. Sheet-by-Sheet Guide

Master_Rule_Definitions

The central index of all rules. It defines which metric to check, the logic type (Numeric or Categorical), the operator (e.g., >, <, !=), and the default fail value. If 'Sector-Aware?' is set to 'Yes', the tool will look for thresholds in the Sector Boundary Matrix.

Sector_Boundary_Matrix & Phase 2 Matrix

Defines thresholds that vary by business model. For example, an 'Asset-Light' company will have different healthy RoCE or Debt thresholds than an 'Asset-Heavy' one. It uses Pass, Fail, and Critical caps to categorize results.

Company_Sector_Map & Sector Mapping

Tells the tool how to categorize a company based on industry keywords (e.g., 'SaaS' maps to 'ASSET_LIGHT'). This ensures the correct sector-specific thresholds are applied.

Phase 1 Thresholds

Contains the specific numeric 'trip-wire' values for initial screening rules. These override defaults for high-priority checks.

Phase 3 Thresholds

Sets global parameters used for final scoring and classifications, such as Target CAGR or P/E re-rating ceilings.

3. Key Data Guidelines

Field	Requirement
Metric Names	Input Metrics must match the data source exactly (case-sensitive).
Operators	Use only supported symbols: '>' (Greater than), '<' (Less than), '!=' (Not equal to), '=' (Equal to).
Logic Types	Use 'Categorical' for text-based checks and 'Numeric' for number-based checks.
Structural Integrity	Do not rename, move, or delete column headers, as the upload tool relies on a fixed structure.

4. Upload & Deployment

1. Update rules/thresholds in the .xlsx file.
2. Save the workbook (ensure no active filters or broken formulas).
3. Upload the file via the tool's configuration interface.
4. Validate the upload by running a test evaluation on a known sample company.
